

iStar CCD series

Fast gated ICCD solutions

Intensified CCDs for Nanosecond Time-resolved Imaging

Key Specifications

- < 2 ns true optical gate
- Up to 3,450 spectra/s
- Integrated triple output DDG
- Photocathode peak QE up to 50%
- Integrate-On-Chip gating up to 500 kHz
- -40°C TE cooling
- USB2 interface

Key Applications

- ✓ Plasma studies
- ✓ Time-resolved Fluorescence (LIF, PLIF)
- ✓ Quantum Optics
- ✓ Hyperspectral Imaging
- ✓ Transient Absorption
- ✓ Photon Counting

Introducing iStar for Imaging

Andor's iStar extracts the very best from CCD sensor and image intensifier technologies

Exceptional detection performances are accessed through high quantum-efficiency image intensifiers, thermo-electric cooling to -40°C , 500 kHz photocathode gating rates and enhanced intensifier EBI noise reduction.

Low jitter, low insertion delay gating electronics and nanosecond-scale optical gating provide excellent timing accuracy down to a few $10^{\text{'s}}$ of picoseconds, allowing ultra-precise synchronization of complex experiments through iStar's comprehensive range of input/output triggering options.

Meet the family- key specifications*1

	iStar 312T	iStar 334T
Array format	512 x 512 24 μm	1024 x 1024 13 μm
Effective active area (vs image intensifier \varnothing)		
Frame rate (max, at 16-bit digitization)	15.8 fps 1,031 fps (crop mode) 55,250 fps (fast kinetic)	4.2 fps 333 fps (crop mode) 29,850 fps (fast kinetic)
Pixel well depth	320,000 e^{-}	100,000 e^{-}
Min read noise (e^{-} , typical)*2	5.4	5
Minimum cooling temperature	-40°C	
Image Intensifier options	Gen 2 - Broadband, moderate VUV-NIR QE Gen 3 - VIS-NIR, high QE Gating down to < 2 ns (Fast Gen 2 or Gen 3) or < 100 ns (High QE Gen 2) Phosphor P43 (fast decay) or P46 (ultrafast decay) options	
Recommended Applications	<ul style="list-style-type: none"> High dynamic range imaging Ultra-fast kinetics 	<ul style="list-style-type: none"> High resolution imaging Extended fast kinetic series

NEW The iStar sCMOS is Andor's new ultrafast platform for ns time-resolved imaging & spectroscopy.

It features high frame rates up to 40 fps (4,000 with ROI) through a USB3 interface, with the high accuracy gating performance that you would expect from an iStar.

It is the ideal platform for ultrafast, ns time-resolved imaging.

Features & Benefits

Feature	Benefit
High-resolution sensors and image intensifiers	Sharpest images and spectrum definition, 100% fill factor for maximum signal collection efficiency.
True optical gating < 2 ns	Billionth of a second time-resolution for accurate transient phenomena study.
5 MHz readout platform	Rapid frame and spectral rates for superior characterization of dynamic phenomena. Single readout amplifier for best image digitization uniformity.
Superfast readout options Crop & Fast Kinetic mode	Fully customizable binning sequences for highest spectral and image rates. Greater than 6,667 spectra/s continuous rates, up to 55,250 spectra/s in burst mode.
High QE Gen 2 & 3 image intensifiers	Superior photon capture, with peak QE up to 50% and spectral coverage from 120 to 1,100 nm.
Low jitter, on-board Digital Delay Generator (DDG™)	Highest gating timing accuracy with lowest propagation delay. Software controlled 3x triggering outputs with 10 ps setup accuracy for complex experiment integration.
500 kHz sustained photocathode gating	Maximizes signal-to-noise ratio in high repetition rate laser-based applications.
TE-cooling to -40°C	Efficient minimization of CCD dark current and pixel blemishes.
Photocathode EBI minimization	Dry gas purge interface for further efficient EBI reduction.
Intelligate™	Intelligent and accurate MCP gating for better than 1:10 ⁸ shuttering efficiency in the UV.
Insertion delay as low as 19 ns	Minimum delay between experiment signal generation and actual image intensifier triggering.
USB 2.0 interface	Industry-standard plug-and-play, lockable and rugged interface Seamless multi-camera control from single PC or laptop.
Real-time control interface	On-the-fly software control of intensifier gain, gating and 3x outputs trigger parameters for real-time detection optimization.
2 year warranty	Reliability and guaranteed performance over time.

Deep TE-cooling to -40°C – lowest sensor dark current

- ✓ Experiments involving multi-kHz lasers and extremely weak sample emission, where multiple photocathode gatings can be set within a single CCD exposure. This exposure is typically set to a few seconds to allow for hundreds of thousands of accumulations to occur. During these extended CCD exposures, sensor deep cooling is of the greatest importance.
- ✓ Photon counting, where any noise contribution from any element of the ICCD has to be minimized to allow access to the lowest detection threshold. As Image Intensifiers are fibre coupled to the CCD, the photocathode will see some degree of conductive cooling, which will contribute to minimize the EBI. Further thermal noise reduction can be achieved through the iStar's dry gas purge interface.

Focus on frame rates¹

	312T	334T
Sensor array size	512 x 512	1024 x 1024
Pixel size	24 x 24 μm	13 x 13 μm
Max. readout speed	5 MHz	5 MHz
Frame rates 1x1 full frame 2x2 binning	15.8 fps 28.5 fps	4.2 fps 7.3 fps
Spectral rates (FVB)	323 sps	145 sps
Crop mode rates (spectral, binned) [number of rows equivalent to a 130 μm high channel]	3,571 sps [5 rows]	3,450 sps [10 rows]
Fast Kinetics rates vs. channel heights		
26 μm	37,990 Hz [1 row]	48,780 Hz [2 rows]
50 μm	26,590 Hz [2 rows]	29,850 Hz [4 rows]
100 μm	16,615 Hz [4 rows]	16,805 Hz [8 rows]
200 μm	9,495 Hz [8 rows]	9,525 Hz [15 rows]

Crop mode: Pushing frame and spectral rates further...

The active imaging area of the sensor is defined in a way that only a small section of the entire chip is used for imaging or spectral acquisition.

The remaining area has to be optically masked to prevent light leakage and charge spill-over that would compromise the signal from the imaging area.

By cropping the sensor, one achieves faster frame and spectral rates because the temporal resolution will be dictated only by the time it requires to read out the small section of the sensor.

... and beyond with fast kinetic mode

T1 - CCD "Keep Clean" sequence is interrupted, and useful signal builds-up on the user-defined top portion of a sensor

T2 - At the end of the exposure time, signal is rapidly shifted down by a pre-defined number of rows, and a second exposure takes place

T3 - This process is repeated until the number of acquisitions equals the series length set by user

T4 - The sequence moves into the readout phase by shifting in turn the individual acquisitions to the readout register, which is then read out

Advanced camera specifications

	312T	334T
Array format	512 x 512 24 μm pixels	1024 x 1024 13 μm pixels
Effective active area	12.3 x 12.3 mm	13.3 x 13.3 mm
Register well depth	480,000 e^-	150,000 e^-
Minimum cooling temperature [dark current, $e^-/\text{pix}/\text{s}$] Air cooled Coolant chiller @ 10°C, 0.75 l/min	-30°C [0.25] -40°C [0.12]	-30°C [0.2] -40°C [0.1]
Vertical shift speeds	6.5 to 25.7 μs	6.5 to 12.9 μs
Sensitivity	2.2 to 8.7 e^-/count	1 to 5 e^-/count
Sensor linearity ^{*3}	Better than 99%	
Digitization	16-bit	

Camera and Internal Digital Delay Generator (DDG) Inputs/Outputs

Gate pulse delay & width	Adjustable from 0 ns to 10 s in 10 ps steps
Trigger Outputs	
Output A, B and C	+5V CMOS level with 50 Ω source impedance; can drive 5V into a non-terminating load or 2.5V into 50 Ω load; output synchronized triggers for auxiliary equipment, e.g. lasers, flash lamps, National Instrument™ hardware Individual delays control from 0 ns to 10 s in 10 ps steps Configurable Polarity
Fire	5V CMOS level reference signal for beginning and end of individual sensor exposure
Arm monitor	5V CMOS level reference signal to indicate when system is ready to accept external triggers. Signal goes high when system is ready to accept external triggers (after a readout has finished or sooner if in overlap mode) and goes low when the exposure is finished
Gate & output A, B and C jitter	35 ps rms (relative to external trigger or to each other)
Trigger Inputs	
External trigger	Trigger input for sensor and Digital Delay Generator Up to 500 kHz for Integrate-On-Chip mode
Direct gate	TTL input for exact external control of photocathode width and timing with smallest insertion delay.
Additional Controls	
Gate monitoring	AC coupling from photocathode to monitor exact photocathode on/off switching and timings
Insertion delay	< 19 ns in direct gate operation

Specifications: Gen 2 image intensifiers^{*1}

Photocathode model	18*-03	18*-04	18*-05 †	18H-13	18H-83	18*-E3 ⁴
Useful aperture	Ø18 mm					
Input window	Quartz	Quartz	MgF ₂	Quartz	Quartz	Quartz
Photocathode type	W-AGT	W-AGT	W-AGT	WR	UW	WE-AGT

* Substitute with appropriate gate width option, e.g. 18U-63 (please refer to page 8 for detailed ordering information)

Quantum Efficiency Curves for Gen 3 Image Intensifiers^{*5,10}

Intelligent gating modes

Integrate-On-Chip: 500,000 times more signal per 1 sec CCD exposure

The iStar's Integrate-On-Chip (IOC) mode enables accumulation of useful signal from laser-induced phenomena at frequencies up to 500 kHz, providing greatly improved signal-to-noise, and minimising experiment time. The latter greatly benefits setups where photobleaching-sensitive biological samples are probed. This translates into the possibility to accumulate 500,000 times more signal per 1 second CCD exposure time.

Integrate-On-Chip is fully software-configurable and can be used through extensive kinetic series involving up to 1,000 pre-programmed incremental delays from laser trigger for unrivalled combination of sensitivity and ultra-precise transient phenomena analysis.

Intelligate™: Superior gating in the UV-VUV region

One of the key functions of an image intensifier is to provide high optical shuttering (ON/OFF) ratio. By switching photocathode voltage to a higher or lower level relative to the MCP voltage, photo-electrons can be either directed towards or repelled from the MCP to avoid detection. ON/OFF values of $1:10^8$ are typically measured for Visible/NIR incident light on the photocathode.

However photocathode "leakage" becomes more pronounced in the UV-VUV region (< 300 nm), where more energetic photons have a greater probability to go through the photocathode turned "OFF", reach the MCP to generate an electron that can be detected. This can lead to shuttering efficiency as low as $1:10^4$.

Andor's exclusive Intelligate™ simultaneously gates the photocathode and the MCP. The ultra fast rising edge of the MCP gate pulse switches on the correct potential in a nanosecond timeframe, coinciding precisely with the photocathode gating pulse. This enables ON/OFF ratios as high as 10^8 in the UV-VUV region.

Creating the optimum product for you

Step 1. Choose the CCD matrix size

CCD matrix	Code
512 x 512 CCD matrix, 24 µm pixel	312
1024 x 1024 CCD matrix, 13 µm pixel	334

Step 2. Choose the intensifier diameter

Intensifier Diameter

There is one intensifier option available for the iStar 312 and 334.

Intensifier diameter
Ø 18 mm intensifier (18)

Step 3. Choose a minimum gating speed

GATING SPEED
Gating Speed

Gating Speed	Code
High QE, slow gating	H
Fast Gating	F
Ultra Fast Gating	U

Step 4. Select an image intensifier option

Intensifier

Gen 2 Intensifier option	Code
W-AGT photocathode, P43 phosphor	03
W-AGT photocathode, P46 phosphor	04
W-AGT photocathode, MgF ₂ window, P43 phosphor	05
WR photocathode, P43 phosphor	13
UW photocathode, P43 phosphor	83
WE-AGT photocathode, P43 phosphor	E3

Gen 3 Intensifier option	Code
HVS photocathode, P43 phosphor	63
VIH photocathode, P43 phosphor	73
NIR photocathode, P43 phosphor	93
EVS photocathode, P43 phosphor	A3
BGT photocathode, P43 phosphor	C3

All photocathode types can be combined with a fast-decay P46 phosphor – please contact your local Andor representative for further information

Step 5. Select the required accessories and adapters

Accessories & Adapters

Description	Order Code
C-mount lens adaptor	LM-C
F-mount lens adaptor	LM-NIKON-F
UV-VIS 105mm SLR lens, 250 - 650 nm transmission, F-mount	OL-AF10-F45-#UV
Oasis 160 Ultra compact chiller unit	ACC-XW-CHIL-160
6 mm tubing option for ACC-XW-CHIL-160	ACC-6MM-TUBING-2xxxxM
i ² c to BNC cable for Shamrock shutter control	ELC-05323
Metric Bracket	ACC-ISTAR-METRIC ADP

Step 6. Select the required software

Software

The iStar ICCD requires at least one of the following software options:

Solis for Time-Resolved A 32-bit and fully 64-bit enabled application for Windows (XP, Vista, 7 and 8) offering rich functionality for data acquisition and processing. AndorBasic provides macro language control of data acquisition, processing, display and export.

Andor SDK2 A software development kit that allows you to control the Andor range of cameras from your own application. Available as 32 and 64-bit libraries for Windows (7 and 8) and Linux. Compatible with C/C++, LabView and Matlab.

Product drawings

Dimensions in mm [inches]

Weight: 4.2 kg [9 lb 4 oz]

■ = position of pixel 1,1

Connecting to the iStar

Camera Control

Connector type: USB 2.0

Logic Input / Output

Connector type: SMA, provided with SMA - BNC cable
5x outputs: FIRE pulse, Output A, B, C from DDG™ and ARM
2x inputs: Camera trigger from 3rd party source & direct gate for complete, direct external control of intensifier gating

I²C connector

Compatible with Fischer SC102A054-130, pin-outs as follow:
1 = Shutter (5V CMOS level with 50 Ω impedance), 2 = I²C Clock (5V), 3 = I²C Data (5V), 4 = +5 Vdc, 5 = Ground

Gate Monitor

1x output: AC coupling to photocathode

Mounting hole locations

Gate monitor

AC coupling to photocathode provides the most reliable timing information on actual gating occurrence

Dry gas purge

Minimizes Electron Background Illumination (EBI) thermally generated at the photocathode to improve detection threshold

ORDER TODAY

Need more information? At Andor we are committed to finding the correct solution for you. With a dedicated team of technical advisors, we are able to offer you one-to-one guidance and technical support on all Andor products. ITEMS SHIPPED WITH YOUR CAMERA

Power Brick, 12V, 120W single line
2x 2m BNC to SMA cable
1x Gate Monitor cable
3 Metre USB cable A to B type, shielded (1off)
1x Quick launch guide
1x CD containing Andor user guides
1x Individual system performance booklet

Regulatory Compliance

Compliant with the requirements of the EU EMC and LV Directives through testing to EN 61326-1 and EN 61010-1.
External power supply PSE-approved

Footnotes: Specifications are subject to change without notice

1. Figures are typical unless otherwise stated.
2. Measured for the entire system. Combination of CCD readout noise and A/D noise - measurement is for single pixel readout with -30°C CCD cooling and at minimum exposure time under dark conditions. Values quoted are measured with highest available PAG setting.
3. Linearity is measured from a plot of counts vs exposure time under constant photon flux up to the saturation point of the system.
4. The On/Off ratio of the 'E3' image intensifier in the UV with MCP gating is typically 10⁵.
5. Typical photocathode Quantum Efficiency and input window transmission as measured by the tube manufacturer.
6. Typical resolution of the image intensifier tube only, not the overall resolution of the system. As a rough guide, the smallest resolvable FWHM feature will be approximately 2x the CCD pixel size. This is a very important consideration for optical resolution calculations in spectrograph-based systems.
7. Gen 2 High QE (H) option - Photocathode QE is inherently linked to the gating speed of the intensifier. High QE option (H) offers higher peak QE than Ultrafast (U) or Fast (F) intensifiers, while exhibiting minimum gating speed one order of magnitude slower.
8. Actual measured minimum optical gating of the photocathode, reflecting not only the electrical pulse width applied to the photocathode but also its inherent iris time.
9. Gain is software-selectable through a 12-bit DAC and varies exponentially with DAC setting. Value refers to the ratio of max to min intensifier gain as measured for individual cameras. Actual optical gain (counts/ photoe) for a DAC setting is accessed by the multiplication of the relative gain (at that DAC value) by the minimum system gain (at DAC = 0, CCD e⁻/photoe) and divided by the sensitivity (CCD e⁻/count) at a given CCD PAG. Sensitivities are individually measured and reported for each system.
10. Combination of -73 GaAsP photocathode with a lumogen-coated fibre-optic plate and protective MgF₂ window. The latter additional optical interfaces are the reason for the lowered QE in the visible NIR region, for the -C3 model.

Minimum Computer Requirements:

- 3.0 GHz single core or 2.4 GHz multi core processor
- 2 GB RAM
- 100 MB free hard disc to install software (at least 1 GB recommended for data spooling)
- USB 2.0 High Speed Host Controller capable of sustained rate of 40 MB/s
- Windows (XP, Vista, 7 and 8) or Linux

Operating & Storage Conditions

- Operating Temperature: 0°C to 40°C ambient
- Relative Humidity: < 70% (non-condensing)
- Storage Temperature: -20°C to 55°C

Power Requirements

- 100 - 240 VAC, 50 - 60 Hz
